

CLI which stands for command line interface and GUI which stands for graphical user interface can seem like the same to the untrained eye. One is physically visible and the other is lines of text, while this may be true, both types can provide different means to an answer or goal. CLI for example doesn't call for as many "ingredients" as GUI. since the command line is a series of characters it may be more accessible for one who was learned their way around this interface to use and direct commands. Command line can easily be looked at as its own language. Using the identical sequences for certain outcomes. A key difference is that the command line does not have access to some graphical perks used to accessorize.
